

习题二

T2.4解:

由题, $h[n-k] = \begin{cases} 1, & n-15 \leq k \leq n-4 \\ 0, & \text{其他} \end{cases}$

当 $\begin{cases} n-15 \leq 3 \\ 3 \leq n-4 < 8 \end{cases}$, 即 $7 \leq n < 12$ 时

$$y[n] = \sum_{k=3}^{n-4} (1 \times 1) = n-6$$

当 $\begin{cases} n-15 \leq 3 \\ n-4 \geq 8 \end{cases}$, 即 $12 \leq n \leq 18$ 时,

$$y[n] = \sum_{k=3}^8 (1 \times 1) = 6$$

当 $\begin{cases} 3 < n-15 \leq 8 \\ n-4 > 8 \end{cases}$, 即 $18 < n \leq 23$ 时,

$$y[n] = \sum_{k=n-15}^8 (1 \times 1) = 24-n$$

当 n 为其他值时 $y[n] = 0$,

综上, $y[n] = \begin{cases} n-6, & 7 \leq n < 12 \\ 6, & 12 \leq n \leq 18 \\ 24-n, & 18 < n \leq 23 \\ 0, & \text{其他} \end{cases}$

T2.11解:

(a) 由题, $x(t) = \begin{cases} 1, & 3 \leq t \leq 5 \\ 0, & \text{其他} \end{cases}$, $h(t) = \begin{cases} e^{-3t}, & t \geq 0 \\ 0, & \text{其他} \end{cases}$

$\therefore x(t-\tau) = \begin{cases} 1, & t-5 \leq \tau \leq t-3 \\ 0, & \text{其他} \end{cases}$

当 $\begin{cases} t-3 > 0 \\ t-5 \leq 0 \end{cases}$, 即 $3 < t \leq 5$ 时,

$$y(t) = \int_0^{t-3} e^{-3\tau} d\tau = \frac{1-e^{-3(t-3)}}{3}$$

当 $t-5 > 0$, 即 $5 < t < \infty$ 时,

$$y(t) = \int_{t-5}^{t-3} e^{-3\tau} d\tau = \frac{e^{-3(t-5)} - e^{-3(t-3)}}{3}$$

综上, $y(t) = \begin{cases} \frac{1-e^{-3(t-3)}}{3}, & 3 < t \leq 5 \\ \frac{e^{-3(t-5)} - e^{-3(t-3)}}{3}, & 5 < t < \infty \end{cases}$

b) 由题, 设 $s(t) = \frac{dy(t)}{dt} = \delta(t-3) - \delta(t-5)$

$$\begin{aligned} \therefore g(t) &= [\delta(t-3) - \delta(t-5)] * h(t) \\ &= \delta(t-3) * h(t) - \delta(t-5) * h(t) \\ &= h(t-3) - h(t-5) \\ &= e^{-3(t-3)} u(t-3) - e^{-3(t-5)} u(t-5) \end{aligned}$$

(c) 由卷积的微分性质得,

$$g(t) = \frac{dy(t)}{dt}$$

证明:

当 $3 < t \leq 5$ 时, $\frac{dy(t)}{dt} = -\frac{1}{3} \times (-3) e^{-3(t-3)} = e^{-3(t-3)}$

$$= e^{-3(t-3)} u(t-3)$$

$$= e^{-3(t-3)} u(t-3) - e^{-3(t-5)} u(t-5)$$

当 $5 < t < \infty$ 时, $\frac{dy(t)}{dt} = \frac{1}{3} \times (-3) e^{-3(t-5)} - \frac{1}{3} \times (-3) e^{-3(t-3)}$

$$= e^{-3(t-3)} - e^{-3(t-5)}$$

$$= e^{-3(t-3)} u(t-3) - e^{-3(t-5)} u(t-5)$$

综上, 该结论成立.

T2.17 解:

(a) 设通解为 $y_h(t) = Ae^{dt}$

由题, $d+4=0$, $\therefore d=-4$, $\therefore y_h(t) = Ae^{-4t}$

设一个特解为 $y_g(t) = ke^{(-1+3j)t}$

代入原方程得 $(-1+3j)ke^{(-1+3j)t} + 4ke^{(-1+3j)t} = e^{(-1+3j)t}$

$$\therefore k = \frac{1}{3+3j} = \frac{1-j}{6}$$

$$\therefore y_g(t) = \frac{1-j}{6} e^{(-1+3j)t}$$

又 $y(0_+) = 0$, 且输入有限, $\therefore y(0_+) = 0$.

$$\therefore y(t) = y_h(t) + y_g(t) = Ae^{-4t} + \frac{1-j}{6} e^{(-1+3j)t}$$

$$\therefore y(0_+) = A + \frac{1-j}{6} = 0, \therefore A = -\frac{1-j}{6}$$

$$\text{综上, } y(t) = \left[-\frac{1-j}{6} e^{-4t} + \frac{1-j}{6} e^{(-1+3j)t} \right] u(t)$$

(b) 由题,

$$x'(t) = e^{-t} \cos(3t) u(t) = \operatorname{Re} \{x(t)\}$$

$$= \operatorname{Re} \{e^{(-1+3j)t} u(t)\}$$

$$\therefore \text{新的输出 } y(t) = \operatorname{Re} \left\{ \left[-\frac{1-j}{6} e^{-4t} + \frac{1-j}{6} e^{(-1+3j)t} \right] u(t) \right\}$$

$$= \frac{1}{6} [e^{-t}(\cos 3t + \sin 3t) - e^{-4t}] u(t) \quad y(t) = 1, \forall t$$

(c) 当 $T=\frac{3}{2}$ 时,

$$y(t) = \begin{cases} 0.5, & \text{其他} \\ 1 - |t - \frac{3}{2}k|, & \frac{3k-1}{2} \leq t \leq \frac{1-3k}{2} \end{cases}$$

(d) 当 $T=1$ 时,

T2.23 解:

$$\therefore x(t) = \sum_{k=-\infty}^{+\infty} \delta(t-kT),$$

$$\therefore y(t) = x(t) * h(t) = \sum_{k=-\infty}^{+\infty} h(t-kT)$$

(a) 当 $T=4$ 时,
